The next summary of the *Wheat Outlook and Situation* is scheduled for release on July 26. It will appear on the AGNET computer system by 3:30 ET the same day. The full text and tabular materials will be added to AGNET approximately 2 business days later. For more information on AGNET, call (402) 472-1892.

Summary

Heavy Program Participation Will Cut 1983 U.S. Wheat Crop

Harvesting of the 1983 wheat crop is underway, with growers expected to combine the smallest acreage in 4 years, a result of Government efforts to reduce U.S. wheat supplies. Wheat production has ballooned to record heights in each of the last three harvests, burdening the industry with excessively large stocks.

Initially, winter wheat seeding was down 3.4 million acres from 1982/83, but enrollment in the payment-in-kind (PIK) program, announced after planting, idled additional cropland, leaving an expected 47 million acres to be harvested, 11 million less than last year. Higher yields will offset some of the acreage reduction, but as of May 1, 1983, winter wheat production was forecast at 1.9 billion bushels, 215 million below 1982's record. In addition, heavy program participation by spring wheat growers will decrease their 1983 plantings about a third, which will mean a sharp cutback from last year's record crop of 700 million bushels. The total 1983 wheat crop is forecast at 2.35 billion, down 450 million from 1982's record.

Despite the reduced harvest, total supply will be only fractionally smaller than 1982/83's record because of a large carryin. Early prospects for demand are limited, with exports expected to be down from 1982/83 and only a slight increase in domestic use. Because total wheat

use will about match 1983's production, yearend stocks on May 31, 1984, will remain record high. However, "free" readily marketable stocks will increase substantially because nearly half of the stocks isolated in the farmer-owned reserve will be used for PIK. Under these conditions, the average farm price may be only slightly better than 1982/83's \$3.53 a bushel, within a range from \$3.50 to \$3.75.

The largest wheat supply on record dominated 1982/83. Concurrently, the volume of exports declined substantially from 1981/82's record pace. Domestic food and feed use of wheat rose, though not enough to prevent a stock buildup for the third straight year. The large supply and weak exports pushed farm prices below the \$3.55-a-bushel loan rate for most of the season. Many eligible producers found the farmer-owned reserve an attractive marketing option and placed a fifth of 1982's production in that program.

Early prospects for world wheat output in 1983/84 suggest that production may be close to 1982/83's record 479 million metric tons. With large carryin stocks, the supplies of major exporters will be more than adequate to meet import demand, even if their production falls slightly. World trade will probably be below the 100-million-ton mark, with aggressive competition among exporters likely to continue.

Wheat Situation

OUTLOOK FOR 1983/84

Reduced Harvested Area Cuts 1983 Winter Crop Substantially

Faced with serious and worsening surpluses of wheat supplies, USDA added the payment-in-kind (PIK) program to its earlier announced 15-percent acreage reduction (ARP) and 5-percent paid land diversion (PLD) programs. In exchange for idling a large portion of their cropland, producers who participate in PIK, will receive as compensation wheat stocks owned by the Commodity Credit Corporation (CCC) or obligated to the regular or reserve loan programs. Farmers signed up to include 86 percent of their 90.9 million acres of wheat cropland base in the overall reduction program, designating 59 percent of their enrollment to the partial and whole-base PIK. If all participants remain in compliance (those in the ARP and PLD may withdraw without a penalty), 32 million acres of wheat land may never see a combine this year.

Last fall winter wheat seedings were only about 3.5 million acres below the area that produced the record 1982 crop. This was an indication that the ARP and PLD programs would be of limited effectiveness in lowering 1983 production. However, because price expectations were disappointing, producers responded favorably to the PIK option. Nearly 21 million acres of the winter wheat base will be idled this year, leading to an expected harvested acreage of 47 million, 11 million below last year. With record high yields offsetting some of the effect of reduced acreage, the May 1 forecast of the 1983 winter wheat crop is 1.9 billion bushels—more than 200 million below 1982's record. The section on wheat by class gives more breakdown on the production forecast.

Heavy Program Participation To Sharply Reduce Spring Wheat Crop

Prospects for excessively large spring wheat supplies and the lowest prices in 4 years heavily influenced producers of Durum, Hard Red Spring, and White Spring wheat to enroll nearly all of the base acreage possible in the 1983 acreage reduction programs. As a result, an estimated 7 million acres of wheat land, mostly in the Northern Plains, will not be seeded in 1983. While seeding may be delayed because of extended cold, wet weather, good soil moisture should be favorable to yields. Still, because of program compliance, total production could be below the drought-stricken 1980 crop of 479 million bushels.

1983 Harvest To Be Lowest in 4 Years; Supplies To Remain Large

An exceptionally mild winter and near-optimal precipitation over the last few months has reduced the uncertainty that often surrounds the early-season crop outlook. Many areas in the Great Plains have the potential for record yields. However, excessive rains, particularly in the South, have reduced yield potential in some

Soft Red Winter States. Overall, the large acreage reduction due to program compliance is the major factor that will reduce the total 1983 wheat harvest to a projected 2.35 billion bushels, about 15 percent below last year's record 2.8 billion. Since winter wheat accounts for the bulk of the crop, the uncertainty surrounding the current forecast is relatively small. Chances are about 2 out of 3 that the final outcome will fall within 180 million bushels of the current projection. Even with the expected drop in production, 1983/84 will have total supplies near 1982/83's alltime high because of record carryover stocks.

This year's effort to bring wheat supply and use into balance depends much more heavily on the acreage reduction programs than demand expansion. Current projections for 1983/84 disappearance indicate a modest decline from last season. The potential for another large global harvest in 1983, including gains in major importing countries, underlines the forecast for a slight decrease in world wheat trade in 1983/84. Thus, market competition among major exporters will remain keen, with U.S. exports likely to decline nearly one-tenth in 1983/84.

Domestic use of wheat for feed may exceed 1982/83's projected 200 million bushels, as tightening feed grain supplies will likely make wheat more price competitive through the early months of the season. Food use is projected to increase in line with the past growth trend. In total, 1983/84 wheat disappearance could about match production, so yearend stocks will likely remain record high, well above levels of recent years.

One important aspect is that "free" or readily marketable stocks will increase substantially, because nearly half of the farmer-owned reserve (FOR) will be used for PIK. Also, except for the 147-million-bushel Food Security Reserve, all stocks belonging to the CCC will find their way into the market. Furthermore, early entry of grain into the FOR will not be allowed, contrasting the immediate entry policy in 1982/83. For 1983/84, the FOR loan rate was established at the \$3.65 loan rate, compared with \$4 in 1982/83. So, the incentive to isolate the 1983 crop from the market will be smaller.

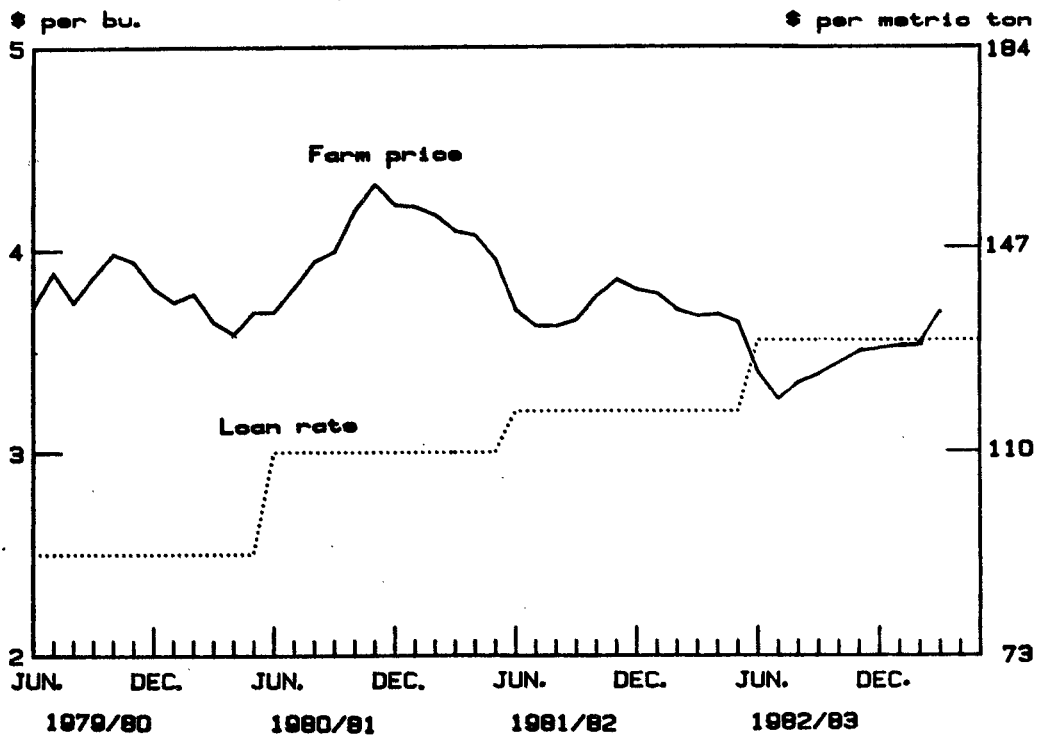

These supply/demand prospects suggest that the farm price for wheat next year could average only marginally above this year's \$3.53, with a range of \$3.50 to \$3.75 a bushel. Heavy participation in Government programs will make a good share of 1983's crop eligible for the \$3.65 loan. Still, market prices could be at or slightly below the loan rate at harvest time because PIK grain from currently unmarketable reserve stocks becomes available at that time. However, the program feature whereby the CCC will pay up to 5 months of storage costs on PIK grain should allow orderly marketing thereby softening the price-depressing effect. Currently outstanding wheat export sales for delivery in 1983/84 are nearly 55 percent behind the pace of a year ago. If this continues, it will also likely limit any early-season price advances.

U. S. Wheat Exports by Months, Marketing Years 1981/82 and 1982/83

Includes flour and products in wheat equivalent.

Wheat Prices Received by Farmers

THE CURRENT SITUATION

Wheat Stocks at Record High; Disappearance Fades

Wheat stocks on April 1 totaled a record 1.9 billion bushels, 20 percent more than a year ago. This is enough wheat to sustain domestic consumption for about 2 years without any added production. Since last June, producers placed one-fifth of 1982's record production into the reserve. Adding this to FOR stocks from prior crops, total wheat in the reserve represented 58 percent of April's supply. These stocks, plus another 185 million bushels owned by CCC, are not available to commercial buyers at current market prices.

A 14-percent decline in exports during June-March offset the tightening supplies. Only domestic food and feed use will show expanded consumption during this crop year, while seed use and, particularly, exports will decline. The pace of wheat use during April and May is not expected to change appreciably, leading to another buildup of yearend stocks—the third year in a row.

Domestic food use during June-March was running about 1.5 percent above a year earlier. Production of wheat flour in calendar 1982 was the second largest on record, up slightly from a year ago (table 3A). However, overseas flour shipments rose during this time, so the net effect was reduced domestic flour use. On a per capita basis, domestic flour consumption in 1982 dropped 2 pounds. This blip in a rather stable series for food use may be a result of the recession, which may have reduced away-from-home food expenditures, thereby resulting in lower consumption of bakery products.

Wheat: supply and disappearance

Seed	84	79
Feed	146	225
Total disappearance	2,233	2,111
April 1 stocks	1,557	1,869

1/Includes imports.

*ELP
MOT*

The pace of wheat feeding during June-March was slightly above the annual projection of 200 million bushels. According to the method used to quantify feeding—the residual between stocks at one date compared with the estimated stocks at a later date—feeding was about 80 million bushels more than a year earlier. This indicates increased wheat use in feed rations. Low Soft Red Winter wheat prices all season likely meant more wheat in poultry rations. The situation was similar for hard wheats in livestock feed.

January-March Exports Improve; Season Shipments To Be Lower

This season's export loadings of wheat continue to be substantially off from the 1981/82 record. The monthly shipping rate during January-March increased 25 percent from the slow tempo established during the first half of the marketing year (June-December). However, with the end of the season nearly at hand, it is obvious that 1982/83 exports will be nearly 250 million bushels short of last year's record 1.77 billion bushels. Much of this shortfall comes from noticeable reductions in purchases from the Soviet Union, China, and both Western and Eastern Europe. In addition, some traditional Latin American customers cut back on buying because of financial restraints. Only sales to India and Iraq were substantially larger. Total U.S. exports this season, at 1.525 billion bushels, will still be the second largest on record, but the decrease from last season will end the run of 5 successive years of increasing volumes.

Farm Price Shows Some Seasonal Improvement

Monthly average farm prices during the first half of 1982/83 were in the doldrums, being unable to top the \$3.55-a-bushel loan rate. This barrier was finally overcome as increased export demand, coupled with record placements of the 1982 crop into the reserve, and the announcement of the PIK program in early January pushed the average price up to \$3.65 a bushel during the first 4 months of 1983. Still, it is likely that the 1982/83 farm price will average below the loan rate, a situation that last occurred in 1968/69.

Currently, the leading question concerns the level of farm prices for the new crop. As of early May, July contract prices in the three futures markets were fairly close to quotations of a year ago. This could be interpreted as signaling new-crop prices similar to those in 1982. Since the 1983/84 loan rate was raised 10 cents a bushel to \$3.65, farm prices may again be below the loan rate during the coming harvest. Any major price increase during 1983/84 will hinge on unforeseen events here and abroad that would improve world trade prospects.

WORLD WHEAT OUTLOOK

Production Prospects for 1983/84

Winter grain acreage sown in the Northern Hemisphere last fall was down slightly, mainly reflecting the United States' major effort to cut production. It appears that other areas will continue their efforts to expand production for domestic needs, and exporters will attempt to further augment their markets. Taking the

widespread moderate winter into consideration, and assuming normal spring wheat growing conditions, the 1983/84 global wheat harvest could be close to last year's record outturn of 479 million metric tons.

The area sown to winter wheat is estimated to be up slightly in *Western Europe*, and the condition of the crop seems to be unusually good as the spring growing season develops. The dry conditions on the Iberian Peninsula will affect the size of that area's production. Fall seeding of wheat in *Eastern Europe* increased slightly in all countries except Poland, where early-season dryness caused poor stand development. Some spring replanting is likely, but Poland's harvest may suffer from the scarcity of yield-boosting inputs—fertilizer and pesticides. Area may be down in the *Soviet Union*, because dry fall weather persisted at seeding time causing some traditional wheat land to be left unplanted. However, a mild winter followed by spring rains was beneficial to both winter and spring wheat prospects. Although uncertainty surrounds the final USSR wheat outturn, with much depending on the development of the spring wheat crop, 1983's production is likely to be up slightly from 1982.

In *North Africa*, Algeria, Tunisia, and Morocco intended to expand their wheat growing area. However, early-season dryness delayed seeding and may have prevented some area from being sown. Favorable conditions have returned to some parts of North Africa, but production seems likely to fall below last year. Reflecting a shift from rapeseed production, a 3 to 4-percent increase in winter wheat planting in *China* could mean larger pro-

duction if favorable moisture continues. Continued expansion in *India's* wheat area is likely to push 1983 production above the 1982 record. Excellent development conditions should produce enough wheat in *Pakistan* to continue its recent exporting of surpluses.

Despite lower initial payments by the Wheat Board, *Canadian* growers intend to plant nearly 7 percent more area than that which produced the 1982 record crop. Favorable spring weather will likely make these intentions a reality. Flood damage will probably make *Mexico's* wheat harvest lower than in 1982. In the *Southern Hemisphere*, early planting projections are down sharply in Brazil, but only slightly in Argentina, whereas record seedings are forecast for Australia.

World Wheat Trade May Be Down Slightly

On balance, the world wheat situation in 1983/84 will most likely resemble the previous year: production will exceed use; world trade will be slightly below the 100-million-ton mark; and prices are unlikely to rise significantly from 1982/83. Because of large carryin stocks, exporters' supplies will be more than adequate to meet import requirements in 1983/84, even where production falls slightly. Aggressive competition among exporters is likely to continue, as each seeks to maintain a share of the contracting world market. As a result, the United States—the largest exporter—will probably see a significant decline in export volume, falling more than 20 percent below the record shipments in 1981/82.

STRATEGIES OF THE MAJOR WHEAT EXPORTERS

The major wheat exporters—the United States, Canada, Argentina, the EC, and Australia—have resorted to more aggressive export marketing this season because of mounting pressures from record world production, huge stocks, low prices, and stagnant trade. Of the major exporters, only Australia had a smaller wheat crop in 1982/83—output was 47 percent below that of 1981/82. Export programs—ranging from traditional ones, such as donations, barter, credit guarantees, and supply agreements, to the more controversial ones, such as subsidies, price concessions, and low-interest financing—have been used extensively during the past year.

The world trade situation is complex from the perspective of both the exporters and importers. While export prices for wheat are the lowest in several years, many importers have been unable to increase purchases because of financial constraints. The major cause of the depressed prices is a high global stocks-to-use ratio due mainly to above-trend world production. This ratio will reach 21 percent by the end of 1982/83, the highest since the late 1970's, and it is likely to remain near this level for at least another year.

After growing about 6 percent a year during the 1970's, world wheat trade in 1983/84 will likely fall below 100 million tons for the first time in 3 years. This will cause major exporters to seek new ways to dispose of their growing exportable supplies. Tables A and B compare exports, ending stocks, and the market shares of each of the major wheat exporters during the last two decades.

Australia

The Australian Wheat Board (AWB) is the sole marketing authority for its domestic and export sales. Because Australia has little storage capacity, only pipeline supplies are held at the end of the marketing year. The Government does not provide credit guarantees for export sales. The AWB does provide extended payment terms, but only to a limited number of overseas markets. Traditionally, China and Egypt have been the recipients. Besides these countries, Australia has supply agreements with Japan, Iraq, and Iran. These agreements account for roughly 5 million tons.

Argentina

Argentine export sales are transacted by the National Grain Board and private companies. Argentina, the smallest major wheat exporter, engages in long-term agreements to move supplies into the export market. Such agreements with China, Iran, Algeria, and Iraq account for nearly half of its exports. Several countries—Chile, Peru, Haiti, Brazil, Bolivia, and Czechoslovakia—made commitments for the purchase of 1982 wheat and will probably buy from Argentina in 1983, even though there are no formal agreements. Most of Argentina's wheat exports are shipped within the first half of its marketing year to make room for the export seasons of coarse grains and soybeans. Argentina sold most of this year's extraordinarily large crop by undercutting the U.S. export price by as much as \$25 a ton. AWB wheat is kept at a minimum because of storage

WHEAT BY CLASS

Program Compliance Reduces 1983 HRW Crop

Prospects for the 1983 Hard Red Winter (HRW) wheat crop have been up and down. Without being aware that PIK would come along, HRW growers seeded nearly as much acreage last fall as that which produced the record 1982 crop. While dryness threatened early development, a relatively mild Great Plains winter and improved precipitation brightened prospects. At the same time that prospects were improving, growers were faced with decisions about enrolling in the PIK acreage reduction program, and enrollment was surprisingly high. So, based on conditions as of May 1, only weeks from the start of harvest, the 1983 HRW crop is forecast at 1.11 billion bushels, 11 percent short of last year's record 1.26 billion and the smallest production in three seasons.

The May estimate is still subject to last-minute harvesting decisions and weather. Wheat currently planted and growing on conservation use acreage designated for the 15-percent ARP and 5-percent PLD could be harvested if producers who enrolled decide not to comply with those programs. Those farmers in ARP and PLD who decide not to comply lose their program benefits while farmers in the PIK portion not only lose their benefits but are also subject to a monetary penalty.

The accelerated export pace since January has helped augment the disappearance of 1982/83's excessive HRW supplies. This pickup also helped to spark the only major price advance of the Kansas City market all season. Still, the estimate of 900 million bushels of HRW stocks on April 1 is 30 percent larger than the record inventory last April. FOR and CCC stocks represent a much larger share of the April supply—70 percent, compared with 55 percent in 1982.

1982/83 HRS Export Season Looks Bright; Sharp Reduction in 1983 Crop Likely

One of the few bright spots for 1982/83 has been the strength of Hard Red Spring (HRS) exports. This is the only wheat class where exports are expected to be above last year (table 2). Loadings could nearly match the record 245 million bushels exported 10 seasons ago. While the traditional Western European desire for high-protein U.S. wheat faded somewhat, Asian and South American customers expanded purchases of HRS from the United States. Prices for this high-quality U.S. wheat were the lowest in 4 years, with the price of 14-percent protein often on par with or at a discount to HRW ordinary protein (12 percent).

Despite the increased exports, April 1 HRS stocks remained a record-large 510 million bushels. Nearly a third of the 1982 crop was placed into the FOR. This pushed the total HRS isolated from the market to over two-thirds of April's stocks. However, the preponderance of acreage that was enrolled into the partial and whole-base PIK programs means that a sizable share of FOR stocks will be freed up for marketing during 1983/84. Spring wheat growers are likely to withdraw a larger share of acreage from production than growers of any other class. Over 95 percent of their wheat base is enrolled in 1983 programs, suggesting HRS production between 325 to 375 million bushels, down considerably from 1982's 500-million-bushel harvest.

Durum Stocks Remain Large; 1983 Production Prospects Down

Record amounts of Durum continue to be in storage facilities throughout Northern Plains growing areas. April 1 stocks totaled 164 million bushels, a fourth greater than in 1982. With record Durum supplies pressuring the marketplace, producers found the farmer-owned reserve an important alternative to sales. A third of their 1982 production was placed into the reserve, meaning that over 100 million bushels of Durum—two-thirds of total stocks—are isolated from sales at current prices.

The large FOR stocks have done little to strengthen prices, because export demand has been particularly weak. Recent market prices have been sparked by expanded foreign sales for delivery next marketing year. However, Durum exports during 1982/83 will be around 55 million bushels, the smallest in 6 marketing years. Expanded foreign production in 1982 (including a record Canadian crop) along with large old-crop stocks, ballooned the world's Durum supply. This caused Durum prices to remain fairly steady at around \$4 a bushel in Minneapolis, 10 to 15 percent below a year ago. New-crop prices will be tied to crop developments but will also be influenced by the expected heavy payoff of reserve Durum to PIK participants. Thus, the increased amount of readily marketable Durum during 1983/84 will likely limit price advances.

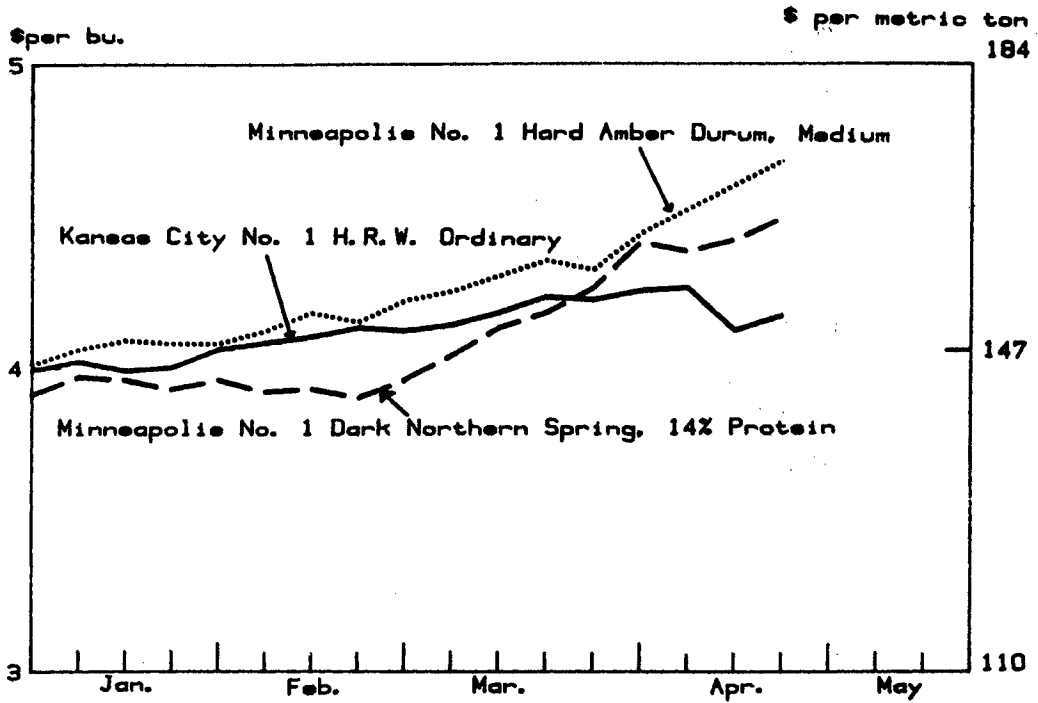

Because either Durum or Hard Red Spring wheat can be grown on the same acreage, the price expectation of each variety may cause some changes in final planting decisions. Thus, the Durum production estimate ranges from 80 to 100 million bushels, compared with last year's 148 million.

SRW Export Pace Declines; Reduced 1983 Crop Likely

The decline of Soft Red Winter (SRW) exports during 1982/83 resulted in April 1 stocks of 130 million bushels, nearly 10 percent larger than a year earlier. This year's exports are off 120 million bushels from 1981/82's record 460 million. SRW has been overwhelmingly the lowest priced U.S. wheat at dockside all season; yet, foreign competition has made inroads into overseas markets. The most significant shortfall comes from a 78-million-bushel drop in Chinese purchases. Some expansion was noted from Latin American and African buyers, likely due to implementation of the blended credit export program. This season's lagging disappearance of SRW will result in abnormally large stocks; the June 1 carryover could climb to nearly 90 million bushels, the largest ever.

SRW producer enrollment in the 1983 acreage reduction programs was much smaller than for other classes. However, 1983 compliance is expected to be up substantially from 1982's level, because the acreage enrolled about doubled. Also significant to prospects for the 1983 SRW harvest is the bigger-than-expected signup in the partial and whole-base PIK programs in States accustomed to double-cropping. So, the May 1 crop forecast of 527 million bushels is 14 percent below last year's 610 million.

Cash Wheat Prices, 1982/83*

* Thursday Price.

Cash Wheat Prices, 1982/83*

* Thursday Price.

**White Wheat Receives Top Prices in 1982/83;
Record Yields Increase 1983 Harvest**

As 1982/83 draws to a close, it is obvious that Soft White wheat will have the distinction of being the premium-priced wheat, an unusual circumstance for this low-protein wheat. The combination of a 16-percent production cutback in a crop year that saw a record harvest for all wheat, heavy placement of 1981 and the 1982 crops into the FOR, and strong producer resistance to selling at low prices helped keep farm prices of White wheat 40 to 50 cents a bushel above the national average for much of this season. The extremely short 1983 Australian wheat harvest also helped strengthen prices, as Australia is a major grower of White wheat varieties. Price strength held even though export activity, although strong, trailed last season's record pace by nearly 22 percent. Pricing for the remainder of the year will turn on new-crop prospects, particularly as to the quantity of FOR wheat that will be required to meet PIK requirements. The release of large FOR stocks onto the free market may temporarily depress prices.

Fall seeding for the 1983 White winter wheat crop was up fractionally in the Pacific Northwest. In the final analysis, over 85 percent of the base acreage was enrolled in the combined acreage reduction programs, so some acreage will be plowed under, hayed, or grazed in order to meet the 2-million-plus acres required to be in conserving use for 1983. While harvested acreage will be lower, fields are in good to excellent condition, indicating record yields in the Pacific Northwest. In turn, lower program enrollment by Eastern White wheat growers will result in more area harvested. In combination, the May 1 estimate of the 1983 White winter wheat harvest, at 255 million bushels, makes it the only class with increasing production in 1983.

**Rye Imports Expand;
1983 Production May Be Up**

Despite a significant dropoff of export activity, rye disappearance during June-March was still slightly above the pace of a year earlier. This was due to the largest rye imports in over 20 years. Although totaling only 2.6 million bushels, imports represented 10 percent of 1982/83's total supply. Much of this rye ended up as feed stock, but the lowest carryin in recent years caused large purchases of Canadian rye in order to meet early-season milling demand.

Planted acreage in the major producing States in the Northern Plains is up 40 percent, possibly because the 1983 acreage reduction program does not apply. Stands were in good to excellent condition going into winter dormancy, but a cool, wet spring has delayed development. Nevertheless, the 1983 rye crop could exceed last year's 20.8 million bushels.

Rye: supply and disappearance

	75.3	83.1	96.7	112.2

1/Includes transshipments through Canadian ports; excludes products other than flour. 2/Production data include all harvests occurring within the July-June year shown, except that small grain crops from the early harvesting Northern Hemisphere areas are moved forward; i.e., the May 1980 harvests in areas such as India, North Africa, and Southern United States are actually included in 1980/81 accounting period, which begins July 1, 1980. 3/"Bunker weight" basis: not discounted for excess moisture and foreign material. 4/Utilization data are based on an aggregate of differing local marketing years. For countries for which stock data are not available (excluding the USSR), utilization estimates represent apparent utilization, i.e., they are inclusive of annual stock level adjustments. 5/Stocks data are based on an aggregate of differing local marketing years and should not be construed as representing world stock levels at a fixed point in time. Stocks data are not available for all countries and exclude those such as China and part of Eastern Europe; the world stock levels have been adjusted for estimated year-to-year changes in USSR grain stocks, but do not purport to include the entire absolute level of USSR stocks.

The Answers Are as Near as Your Telephone . . .

900-410-FARM

Farmers, ranchers, and other agri-
business professionals agree on one thing:
any good business decision is an "informed"
business decision.

Agline is a telephone information
service providing current economic and statisti-
cal news from the U.S. Department of Agri-
culture.

Agline is available weekly (Thursday midnight to Friday
midnight) beginning **April 29, 1983**, currently in the **Central Time
Zone**. The 3-minute summary will cost about **\$1.20** on your tele-
phone bill.

Before you make a production or agribusiness decision,
call USDA's **Agline**.
